Let's start our Cialis conversation with some facts about ED. If you ask 10 men to name the

most awful health disorder they can imagine, 9 of them will speak about erection problems. This simple test shows the importance of erectile function in the eyes of modern society. The most impressive thing is men are absolutely right from the physiological point of view as well, naming normal ability to perform sexually as a very precious aspect of men's health. Years of clinical testing proved that normal sex life is vitally important for men's physical and mental health. Two or three intercourses a week help prevent nervous breakdowns, headaches, colds, hypertension (high blood pressure), heart attack, stroke, a number of CNS disorders, diabetes and even cancer. The matter is that sex is a unique natural training for every organ, tissue and body system of a man, [20 mg cialis](#) saying nothing of psychophysical enjoyment and relaxation. - taking erection pills to support your compromised erectile function (you will not have to take Cialis for the rest of your life – when your CNS restores, you will not need any chemical stimulators). - Cialis works within 30-45 minutes, when it takes up to 1 hour for brand pill to become fully effective; - Cialis lasts longer – it stays in the body for almost 36 hours as compared to 24 hours of brand pills; - Cialis can be taken with alcohol, and as for brand 'love pill', manufacturers ask you to keep off alcohol; - Cialis is cheaper than brand pills, and you can always afford normal treatment.
